

Dayflow HRMS - Phase C Implementation Plan

1. Goal Description

Move the application structure forward by mapping routes to clean visual page skeletons and adding a 404 fallback page. This establishes the precise structure for the portals without implementing the final business logic.

2. User Review Required

- Page Skeletons Setup: We will replace the current page mockups under `src/pages/employee/` and `src/pages/admin/` with the exact section skeletons requested in Phase C. These skeletons serve as neat, un-implemented layouts for Amogh and Abhiram to implement business logic in subsequent phases.
- 404 Route Fallback: We will create a `NotFound.tsx` component and bind it to the React Router catch-all route (*), providing a clean "Page not found" display and a button linking back to the login/selector view.
- Phase-by-Phase Execution: As per Sriram's instructions, we will implement Phase C ONLY in this step, validate the build, and pause for your review before proceeding.

3. Proposed Changes

A. 404 Fallback

- Create [`NotFound.tsx`] under `src/pages/` containing "Page not found" headings and redirect button back to `/login`.

B. Employee Portals

- Dashboard: Sections for Today's Attendance, Recent Activity, and Recent Leave Requests.
- Profile: Sections for Personal Information, Job Information, Salary Information, and Documents.
- Attendance: Sections for Today's Attendance and Attendance History.
- Leave: Sections for Leave Balance, Leave Requests, and Apply for Leave.
- Payroll: Sections for Salary Summary and Salary Breakdown.

C. Admin Portals

- Dashboard: Sections for Employee Overview, Attendance Overview, Leave Overview, and Payroll Overview.
- Employees: Search/filter and Employee table placeholders.
- Attendance: Attendance filters and Attendance table placeholders.
- Leave Requests: Pending Requests and Leave request table placeholders.
- Payroll: Payroll summary and Employee payroll table placeholders.

D. Routing Configuration

- Update `App.tsx` to catch all invalid URLs with wildcard (*) mapping to `NotFound` page.

4. Verification Plan

- Build check: Run `npm run build` in `d:\dayflow-frontend` directory.
- Manual navigation check: Test every sidebar option for Employee and Admin portals.
- Catch-all check: Trigger 404 view by entering random URL (e.g. `/employee/random`).
